VASOACTIVE INTESTINAL POLYPEPTIDE RECEPTOR 2 PRECURSOR (VIP-R-2)
(PITUITARY ADENYLATE CYCLASE ACTIVATING POLYPEPTIDE TYPE III RECEPTOR)
(PACAP TYPE III RECEPTOR) (PACAP-R-3).
                                                                                                                                                                                                                                                                                                                                                                                                                             STRAIN-BALB/C; TISSUE-Thymus; MEDLINE-96378694; PubMed-8784257; Delgado M., Martinez C., Johnson M.C., Gomariz R.P., Ganea D.; "Differential expression of vasoactive intestinal peptide receptors 1 and 2 (VIP-R1 and VIP-R2) mRNA in murine lymphocytes.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     J. Neuroimmunol. 68:27-38(1996).

-I-FUNCTION: THIS IS A RECEPTOR FOR VIP AS WELL AS PACAP-38 AND -27, THE ACTIVITY OF THIS RECEPTOR IS MEDIATED BY G PROTEINS WHICH ACTIVATE ADENIXIZ CYCLASE. CAN BE COUPLED TO PHOSPHOLIPASE C.

-I-SUBGEELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

-I-TISSUE SPECIFICITY: EXPRESSED AT HIGH LEVELS IN THE MING CELLS, AT MODERATE LEVELS IN PANOREATIC ISLETS, INSULIN-SECRETING CELLS, LING, BRAIN, STOMACH, AND COLON, AND AT LOW LEVELS IN THE HEART.

-I-SIMILARITY: BELONGS TO FAMILY 2 OF G-PROTEIN COUPLED RECEPPORS.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                       541
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2, A Sequence 2, A Sequence 2, A Sequence 2, A Sequence 9, A Sequence 1, A Sequence 11, A Sequence 11, A Sequence 18,

                                                                                                                              A novel 7-transmembrane receptor (AAW12695) has been identified as a human G-protein parathyroid hormone (PTH) receptor, designated HLTDG74. It shows 48.2% homology to the human PTH receptor. Its amino acid sequence was deduced from a cDNA clone (AAT56619) isolated from a human T cell lymphoma tissue cDNA library. Recombinant HLTDG74 can be produced in transformed host cells and used to screen for (ant)agonist cpds. Agonists may be used to prevent or treat e.g. hypocalcaemia, hypophosphatemia, hypoparathyroidism and chronic tetany by stimulating an increase in serum calcium levels. Anteagonists can be used to inhibit the receptor e.g. for the treatment of osteoporosis, hypercalcaemia, hypoparathyroidism, hypophosphateamia, kidney stone, nephroliasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GNCFPEWDGLICWPRGTVGKISAVPCPPYIYDFNHKGVAFRHCNPNGTWDFMHSLNKTWA 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300

The present sequence is a human G-protein coupled receptor (GPCR) used for comparison with the seven transmembrane domain of a novel GPCR designated h1571. h1571 GPCR polynucleotides and polypeptides may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate GPCR expression. Such diseases includes immune, haematological, fibrotic, hepatic and respiratory diseases including sthma, allergies (e.g. allergic rhinitis and psoriasis), pathogenic infections, chronic inflammatory diseases, organ-specific autoimmunity, graft versus host disease, cystic fibrosis and, in particular, liver fibrosis. The GPCR polypeptides may be used as antigens in the production of antibodies against GPCR and in assays to identify modulators (agonists and antagonists) of GPCR expression and activity. The anti-GPCR antibodies may be used to down requiate GPCR expression and activity. The anti-GPCR antibodies may be used as diagnostic agents for detecting the presence of GPCR may be.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
Nucleic acids encoding a G-prot. coupled receptor polypeptides, useful for preventing, diagnosing and treating, e.g. liver fibrosis and asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes an isolated or purified peptide (I) that is a parathyroid hormone type 2 (PTH2) receptor ligand (Ia) or PTH1 receptor ligand (Ib). (I) has anorectic, neuroleptic, antideperssion, nootropic, analgesic, antimizatine, antidiabetic, osteopathic, hypertensive, cardiant, cytostatic, antiasthmatic and neuroprotective activities, and is an PTH receptor antegonist. The peptide is useful in the treatment of a disorder mediated by binding a PTH2 or PTH1 receptor. The PTH2 receptor and person and a part of the presence of a disorder mediated by binding a person of the PTH2 or pTH1 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                   Tuberinfundibular peptide of 39 residues; TIP39; PTH2 receptor ligand; parathyroid hormone; parathyroid hormone receptor; anorectic; nootropic; PTH2 receptor binding activity; antidepression; neuroleptic; analgesic; antimigraine; antidiabetic; osteopathic; hypertensive; cardiant; cytostatic; antiasthmatic; neuroprotective; PTH receptor antagonist; obesity; eating disorder; metabolic disorder; mental disorder; headache; schizophrenia, dementia; acute pain; chronic pain; migraine; headache; diabetes; osteoporosis; hypercalcaemia; calcium metabolism; hypertension; conqestive heart failure; tumour; asthma; emphysema; restrictive lung disease; demyelinating condition; multiple sclerosis;

                                                                                                                                                                                                                                   The present invention describes an isolated or purified peptide (I) that is a parathyroid hormone type 2 (PTH2) receptor ligand (Ia) or PTH1 receptor ligand (Ib). (I) has anoretic, neuroleptic, antidepression, nootcopic, analgesic, antimitarine, antidiabetic, osteopathic, hypertensive, cardiant, cytostatic, antiasthmatic and neuroprotective activities, and is an PTH receptor antagonist. The peptide is useful in the treatment of a disorder mediated by binding a PTH2 or PTH1 receptor. The PTH2 receptor binding activity may be used in treating obesity or other eating or metabolic disorders, mental disorders (e.g. depression, schizophrenia and dementia), acute or chronic pain, migraine or headaches, diabetes and other metabolic disorders; osteoporosis,
                                                                                                                                                                                                                                                                                                                                                            hypercalcaemia and other disorders affecting calcium metabolism, hypertension, congestive heart failure and control of tumour growth, asthma, emphysema or other restrictive lung diseases, and demyelinating conditions such as multiple sclerosis and leukodystrophies. The present sequence represents a PTHZ receptor which is used in the exemplification of the present invention.
                                                                                                                                                                    New parathyroid hormone type 2 or 1 receptor ligand, useful for treating e.g. migraine or headaches, hypertension, obesity and other eating or metabolic disorders, mental disorders and osteoporosis -

The parathyroid hormone/parathyroid hormone related protein (PTH/PTHrP) receptor protein sequence was deduced form the DNA sequence of the clone OK-H, isolated from opossum kidney (OK) cells. The protein may be used in a therapeutic compsn. to inhibit activation of PTH or PTHrP and thus reduce the level of calcium in the blood. Cpds. capable of competing with PTH or PTHRP for binding can be identified using the protein prod. and DNAs homologous to PTH DNA can be identified using fragments of the clone as probes. The protein may be used for the prodn. of antibodies useful for the treatment, classification, prognosis and/or treatment of disorders related to the interaction between a cell receptor and a ligand such as in hypercalcaemia. The antibody of the invention is immunoreactive with naturally occurring human, rat or opossum PTH receptor. The antibody is useful for treating disorders
                                                                              receptors (AAR92275 and AAR92776) are encoded by CDNA clones OK-H (AAT15945) and OK-O (AAT15946), respectively, isolated from an opossum kidney (OK) cell cDNA library. OK-H and OK-O may be the products of 2 separate genes or of a laboratory artifact. The receptor induces an increase in intracellular cAMP and calcium when challenged with PTH or PTHTP. Recombinant receptors can be produced in vector/host cell systems and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to screen for (ant)agonists and to raise antibodies. Host cells expressing the receptor can be used for diagnostic measurement of PTH serum levels.
                                                                                                                                                                                                                                                               Gaps
                                                                         Parathyroid hormone/parathyroid hormone-related protein (PTH/PTHrP)
          - useful for
         DNA encoding vertebrate parathyroid hormone receptor - useful diagnosis and treatment of e.g. hypercalcaemia, hypo-calcaemia,
                                                                                                                                                                                                                                                               ;

The parathyroid hormone/parathyroid hormone related protein (PTH/PTHIP)

receptor protein sequence was deduced form the DNA sequence of the
clone OK-O, isolated from opossum kidney (OK) cells. The clone OK-O
is identical to the OK-H clone exept at the C-terminal tail as OK-O
encodes a 585 amino acid protein, OK-H encodes one of 515 amino acids.

The difference is attributed to a single nucleotide deleted in the OK-H
sequence causing a frame shift and an earlier stop codon. It is not
known whether OK-O and OK-H represent prods. of two separate genes or
are a laboratory artifact. The protein may be used in a therapeutic
compsn. to inhibit activation of PTH or PTHPP and thus reduce the
compsn. to inhibit activation of PTH or PTHPP and thus reduce the
or PTHPP for binding can be identified using the protein prod, and
DNAs homologous to PTH DNA can be identified using fragments of the
clone as probes. The sequence may be used for the protein of antibodies
useful for the treatment, classification, prognosis and/or treatment of
disorders related to the interaction between a cell receptor and a
ligand such as in hypercalcaemia. See also AAR27704-16.
                                                                                                                                                                                                                                                                                              ö
characterised by overstimulation of PTH receptors by their ligand and for the diagnosis of PTH-related hypercalcaemia.
                                                                                                                                                                                                                                                                                              Gaps

                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Parathyroid hormone/parathyroid hormone-related protein (PTH/PTHrP) receptors (AAR92275 and AAR92776) are encoded by CDNA clones OK-H (AAT15945) and OK-O (AAT15946), respectively, isolated from an opossum kidney (OK) cell CDNA library. OK+H and OK-O may be the products of 2 separate genes or of a laboratory artifact. The receptor induces an increase in intracellular cAMP and calcium when challenged with PTH or PTHrP. Recombinant receptors can be produced in vector/host cell systems
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     and used in the treatment, diagnosis or prognosis of e.g. hypercalcaemia and hypocalcaemia, to screen for (ant)agonists and to raise antibodies. Host calls expressing the receptor can be used for diagnostic measurement of PTH serum levels.

This sequence represents the opossum parathyroid hormone (PTH) receptor OK-O, which is targeted by the antibody of the invention. The antibody of the invention is immunoreactive with naturally occurring human, rat or opossum PTH receptor. The antibody is useful for treating disorders characterised by overstimulation of PTH receptors by their ligand and for the diagnosis of PTH-related hypercalcaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                               The present sequence represents a rat secretin receptor polypeptide.
Secretin is a gastrointestinal hormone that stimulates the secretion of bicarbonate-rich pancreatic fluid. Secretin is produced by specific endocrine cells (S cells) located in the mucosa of the proximal small intestine. Secretion of secretin is stimulated by the presence of either acidic pH or fatty acids in the duodenum. The specification describes a method for modulating the growth state of pancreatic cells. The method for modulating the cells with a secretin therapeutic or product comprises contacting the cells with a secretin therapeutic or product pancreatic cells, in particular to promote the proliferation of pancreatic cells, generate functional pancreatic beta cells from pancreatic listes or cells, promote insulin production in a pancreatic siste or cells, promote insulin inhibition of secretin response in secretin-responsive cells, modify glucose metabolism in an animal to resistance, glucose intolerance or non-responsiveness, hyperglycemia, hyperinsulinemia, obesity, hyperlipidemia, hyperproteinemia or Type II

The present sequence is a human G-protein coupled receptor (GPCR) used for comparison with the seven transmembrane domain of a novel GPCR comparison with the seven transmembrane domain of a novel GPCR comparison with the prevention, treatment and diagnosis of diseases associated with inappropriate GPCR expression. Such diseases includes immune, hemmatological, fibrotic, hepatic and respiratory diseases including asthma, allergies (e.g. allergic and respiratory diseases), pathogenic infections, chronic inflammatory disease, organ-specific autoimmunity, arate production, graft versus host disease, cystic fibrosis and, in particular, liver fibrosis. The GPCR polypeptides may be used as antigens in the production of antibodies against GPCR expression and activity. The anti-GPCR antibodies and GPCR antagonists may also be used to down regulate GPCR expression and activity. The anti-GPCR antibodies may be used as diagnostic agents for detecting the presence of GPCR.
                                                                                                                                                                                                                                                          Nucleic acids encoding a G-prot. coupled receptor polypeptides, useful for preventing, diagnosing and treating, e.g. liver fibrosis and asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The secretin receptor was encoded by a DNA sequence of rat origin, contained in rat/mouse hybridoma NG108-15. The DNA sequence was obtd. from a cDNA library derived from NG108-15 cells. Expression in a suitable host allows prodn. of the receptor protein. The secretin receptor protein encoded by this gene may be used in basic research and in clinical tests, and is available in high yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PTH; parathyroid hormone; conjugate; bone mass; bone reformation; PTH-1 receptor; resorption; remodeling; r-delta-NT/Ct; tethered receptor; osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA coding for secretin receptor – is expressed in COS cells and produces a receptor protein for research and clinical use

Compounds of the structure or formula S-(L)_n-B, R_1-S-(L)_n-R or S-(L)_n-R, are new. Si sa n amino terminal signaling functional domain of parathyroid hormone (PTH); L is a linker molecule present n times (where n is a positive integer 1-10 (preferably 4)); B is a C-terminal binding portion of PTH(1-34) or a PTH-related protein (PTH-rP) (1-34); R_1 is the PTH-1 receptor signal sequence; and R is (a portion of) PTH-1 receptor sequence. The new compounds are used for treating mammalian conditions characterized by decreases in bone mass, determining rates of bone reformation, bone resorption and/or bone remodeling, treating diseases and disorders associated with decreased tether1 activity, increasing cAMP in a mammalian cell having PTH-1 receptors, or screening for a peptide or non-peptide PTH (claimed). The new compound can be administered by inhalation unlike the large native PTH or PTH-P which avoids the need for regular injections to treat osteoporosis.
                                                                                                                                                                                           linked to a carboxy-terminal binding portion of parathyroid hormone for treating mammalian conditions characterized by decreases in bone mass
                                                                                                                                                                New compound comprising an amino terminal signaling functional domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PTH; parathyroid hormone; conjugate; bone mass; bone reformation; PTH-1 receptor; resorption; remodeling; tetherIC; osteoporosis.

                                                                                                                                                                                                                                                                                                                                                                                                                         Compounds of the structure or formula S-(L)_n-B, R_1-S-(L)_n-R or S-(L)_n-R, are new. S is an amino terminal signaling functional domain of parathyroid hormone (PTH): L is a linker molecule present n times (of parathyroid hormone (PTH): L is a linker molecule present n times (where n is a positive integer 1-10 (preferably 4)): B is a C-terminal binding portion of PTH(1-34) or a PTH-related protein (PTH-TP) (1-34); R-1 is the PTH-1 receptor signal sequence; and R is (a portion of) PTH-1 receptor sequence. The new compounds are used for treating mammalian conditions characterized by decreases in bone mass, determining rates of bone reformation, bone resorption and/or bone remodeling, treating diseases and disorders associated with decreased tether1 activity, increasing cAMP in a mammalian cell having PTH-1 receptors, or screening connected by inhalation unlike the large native PTH or PTH P which avoids the need for regular injections to treat osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                 New compound comprising an amino terminal signaling functional domain linked to a carboxy-terminal binding portion of parathyroid hormone for treating mammalian conditions characterized by decreases in bone mass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

Compounds of the structure or formula 5-(L)_n-B, R_1-S-(L)_n-R or S-(L)_n-R, are new. S is an amino terminal signaling functional domain of parathyroid hormone (PTH): L is a linker molecule present n times (where n is a positive integer 1-10 (preferably 4)); B is a C-terminal binding portion of PTH(1-34) or a PTH-related protein (PTH-FP) (1-34); R_1 is the PTH-1 receptor signal sequence; and R is (a portion of) PTH-1 receptor sequence. The new compounds are used for treating mammalian conditions characterized by decreases in bone mass, determining rates of bone reformation, bone resorption and/or bone remodeling, treating diseases and disorders associated with decreased tetherl activity,
                                                                                                                                                                                                                                                             increasing cAMP in a mammalian cell having PTH-1 receptors, or screening for a peptide or non-peptide PTH (claimed). The new compound can be administered by inhalation unlike the large native PTH or PTH-P which avoids the need for regular injections to treat osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Compounds of the structure or formula S-(L)_n-B, R_1-S-(L)_n-R or S-(L)_n-R, are new. S is an amino terminal signaling functional domain of parathyroid hormone (PTH); L is a linker molecule present n times (where n is a positive integer 1-10 (preferably 4)); B is a C-terminal binding portion of PTH[1-34) or a PTH-related protein (PTH-rP) (1-34); R_1 is the PTH-1 receptor signal sequence; and R is (a portion of) PTH-1 receptor sequence. The new compounds are used for treating mammalian conditions characterized by decreases in bone mass, determining rates of bone reformation, bone resorption and/or bone remodeling, treating diseases and disorders associated with decreased tether1 activity, increasing cAMP in a mammalian cell having PTH-1 receptors, or screening for a peptide or non-peptide PTH (claimed). The new compound can be administered by inhalation unlike the large native PTH or PFHFP which avoids the need for regular injections to treat osteoporosis.
                                                                                                                                                                                                                                                                                       New compound comprising an amino terminal signaling functional domain linked to a carboxy-terminal binding portion of parathyroid hormone for treating mammalian conditions characterized by decreases in bone mass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PTH; parathyroid hormone; conjugate; bone mass; bone reformation; PTH-1 receptor; resorption; remodeling; tether1; osteoporosis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a mutant parathyroid hormone (PTH receptor, designated rdeltaNt. The polypeptide is characterised by a deletion of the extracellular amino-terminus ligand binding domain. The receptor has a minimal domain for ligand binding and is, therefore, useful in screening assays designed for the identification of agonists and antagonists of PTH receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                          Compounds of the structure or formula S-(L)_n-B, R_1-S-(L)_n-R or S-(L)_n-R, are new. S is an amino terminal signaling functional domain of parathyroid hormone (PTH); L is a linker molecule present n times (where n is a positive integer 1-10 (preferably 4)); B is a C-terminal binding portion of PTH(1-34) or a PTH-related protein (PTH-rP) (1-34); R_1 is the PTH-r receptor signal sequence; and R is (a portion of) PTH-receptor sequence. The new compounds are used for treating mammalian conditions characterized by decreases in bone mass, determining rates of bone reformation, bone resorption and/or bone remodeling, treating diseases and disorders associated with decreased tetherl activity, increasing cAMP in a mammalian cell having PTH-1 receptors, or screening for a peptide or non-peptide PTH (claimed). The new compound can be administered by inhalation unlike the large native PTH or PTH-P which avoids the need for regular injections to treat osteoporosis.
                                                                                                                                                                                                                                                         New compound comprising an amino terminal signaling functional domain linked to a carboxy-terminal binding portion of parathyroid hormone for treating mammalian conditions characterized by decreases in bone mass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PTH; parathyroid hormone; conjugate; bone mass; bone reformation;

Compounds of the structure or formula S-(L)_n-B, R_1-S-(L)_n-R or S-(L)_n-R, are new. S is an amino terminal signaling functional domain of parathyroid hormone (PTH); L is a linker molecule present n times (where n is a positive integer 1-10 (preferably 4)); B is a C-terminal binding portion of PTH(1-34) or a PTH-related protein (PTH-rP) (1-34); R.l is the PTH-1 receptor signal sequence; and R is (a portion of) PTH-1 receptor sequence; and R is (a portion of) PTH-1 receptor sequence; no mew compounds are used for treating mammalian conditions characterized by decreases in bone mass, determining rates of bone reformation, bone resorption and/or bone remodeling, treating diseases and disorders associated with decreased tetheri activity, increasing cAMP in a mammalian cell having PTH-1 receptors, or screening for a peptide or non-peptide PTH (claimed). The new compound can be administered by inhalation unlike the large native PTH or PTHRP which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New compound comprising an amino terminal signaling functional domain
linked to a carboxy-terminal binding portion of parathyroid hormone for
treating mammalian conditions characterized by decreases in bone mass
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Zebrafish; parathyroid hormone type-1 receptor; PTH1R; developmental disorder; physiological disorder; neurological disorder.

This sequence is a parathyroid hormone receptor type 1 (PTHIR)
receptor protein of the invention. The invention also relates to a PTH3R
receptor protein. Antagonists of PTHIR or PTH3R can be used for the
treatment of diseases associated with an increase in PTHIR or PTH3R
activity, respectively. The peptides are used for diagnosis or prognosis
of diseases and disorders associated with PTH3R or PTHIR, such as cancer.
The polypeptides can be used as a molecular weight markers on sodium
dodecyl sulphate polyacrylamide gel electrophoresis (SDS-PAGE) gels, or
molecular sieve gel filtration columns. Antigenic epitope-bearing
on molecular sieve gel filtration columns. Antigenic epitope-bearing
peptides and polypeptides are useful to raise antibodies, including
monochonal antibodies, that bind specifically to a polypeptide. The
peptides are useful during diagnosis of diseases and disorders in
mammals involving PTHIR or PTH3R receptor expression or function.
Mutations that affect PTHIR or PTH3R sequence and/or expression levels
of PTH3R or PTH3R could be diagnostic for patients with disease or
                                                                                                Novel zebrafish parathyroid hormone/parathyroid hormone related peptide receptor 3 and isolated nucleic acid encoding zebrafish parathyroid hormone receptor 1 for treating disorders associated with receptor
